Last five years: a new €50,000 account, September 2021 to August 2026 (10% volatility target, after costs)

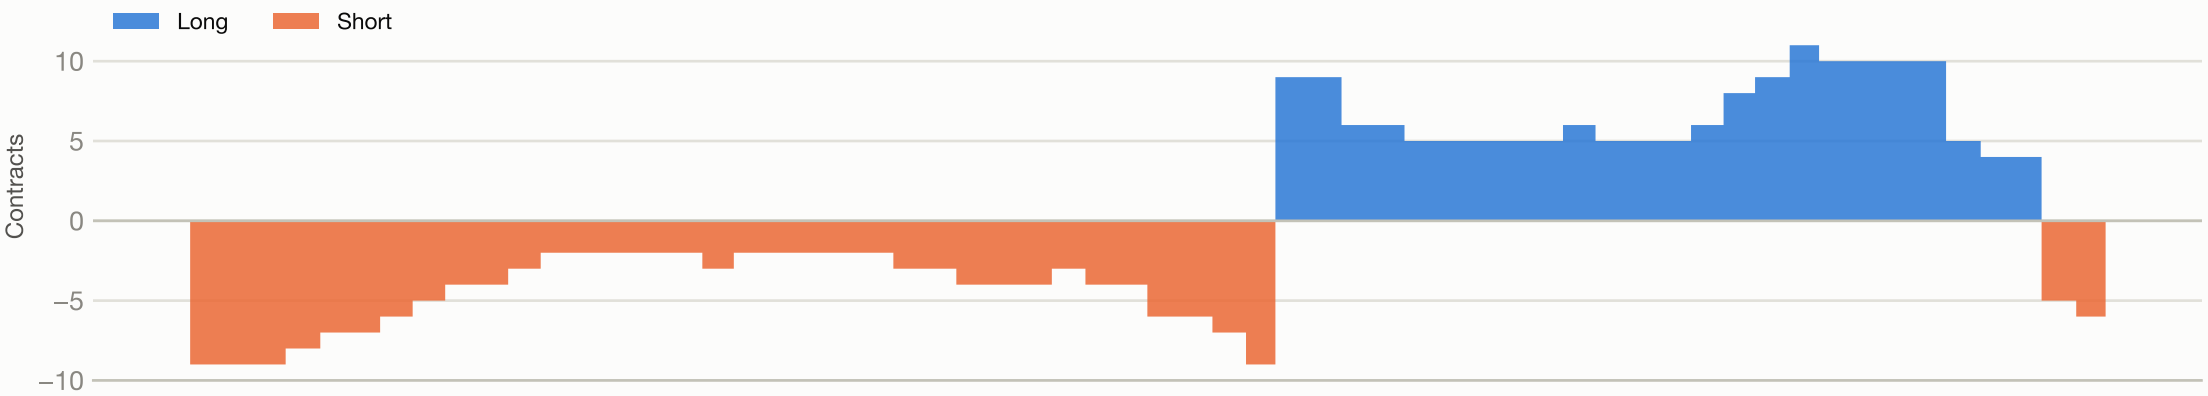

Signal: risk-factor score and the months it overrides ECB rate momentum

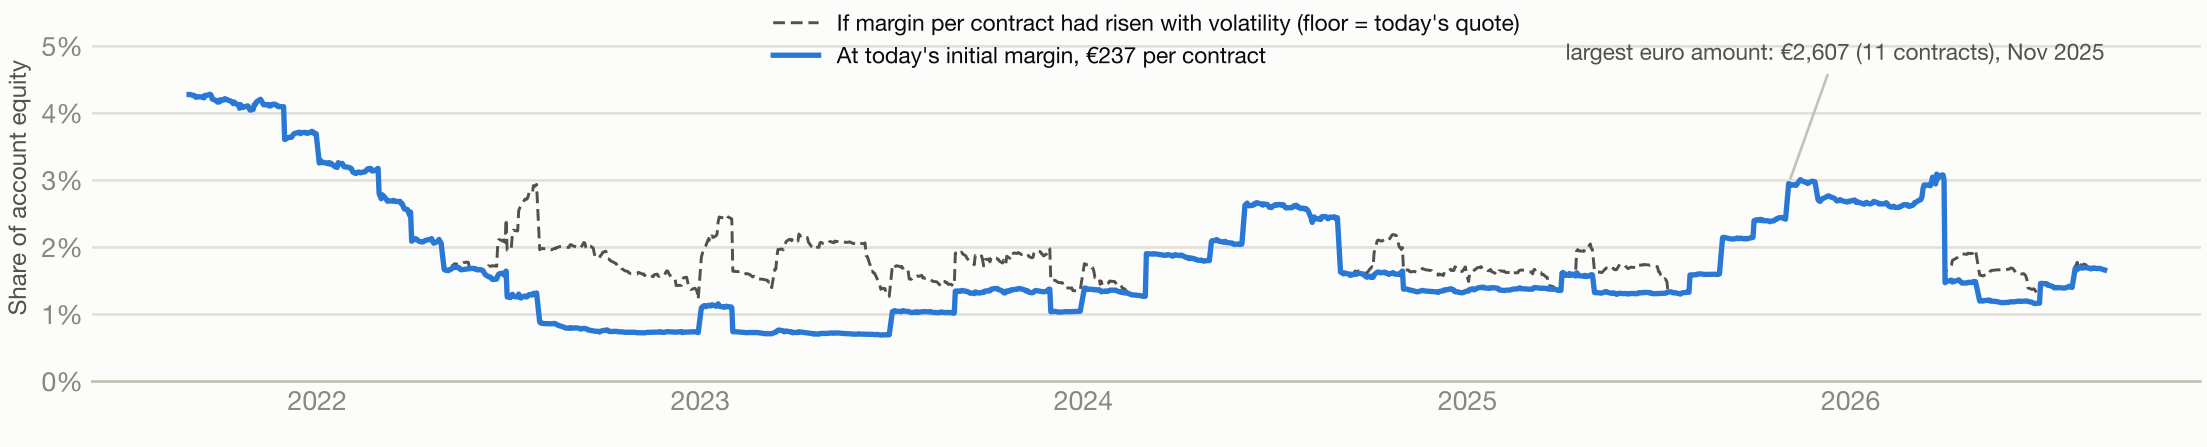

Volatility of the 2nd Euribor contract (annualised, basis points of price)

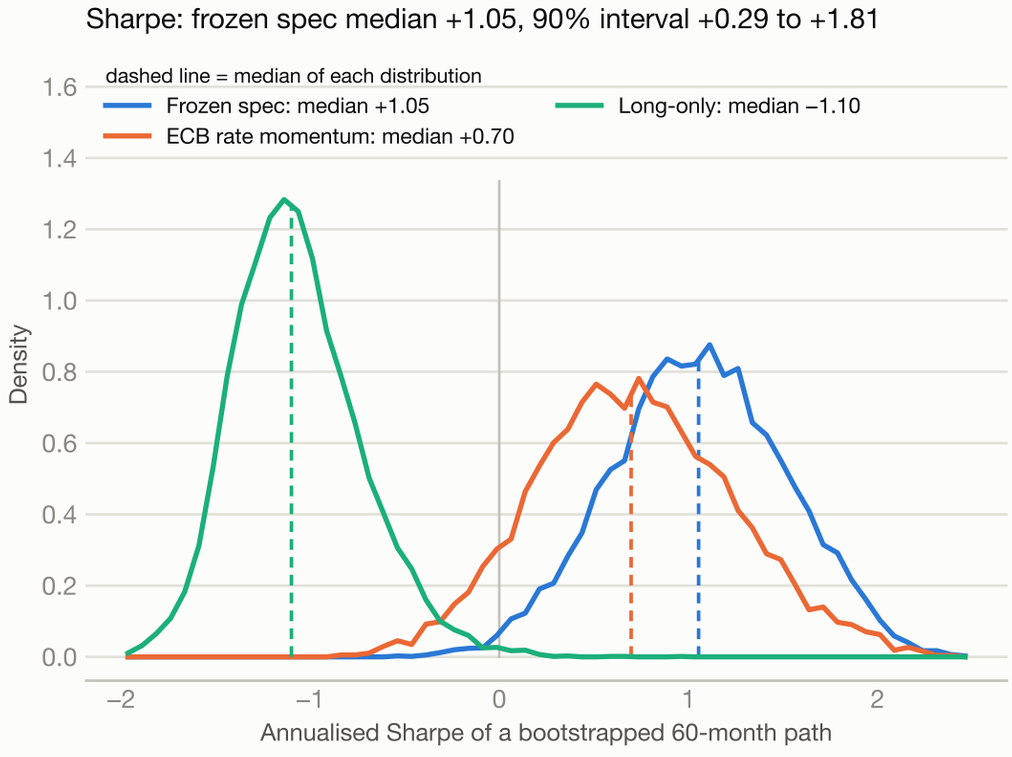

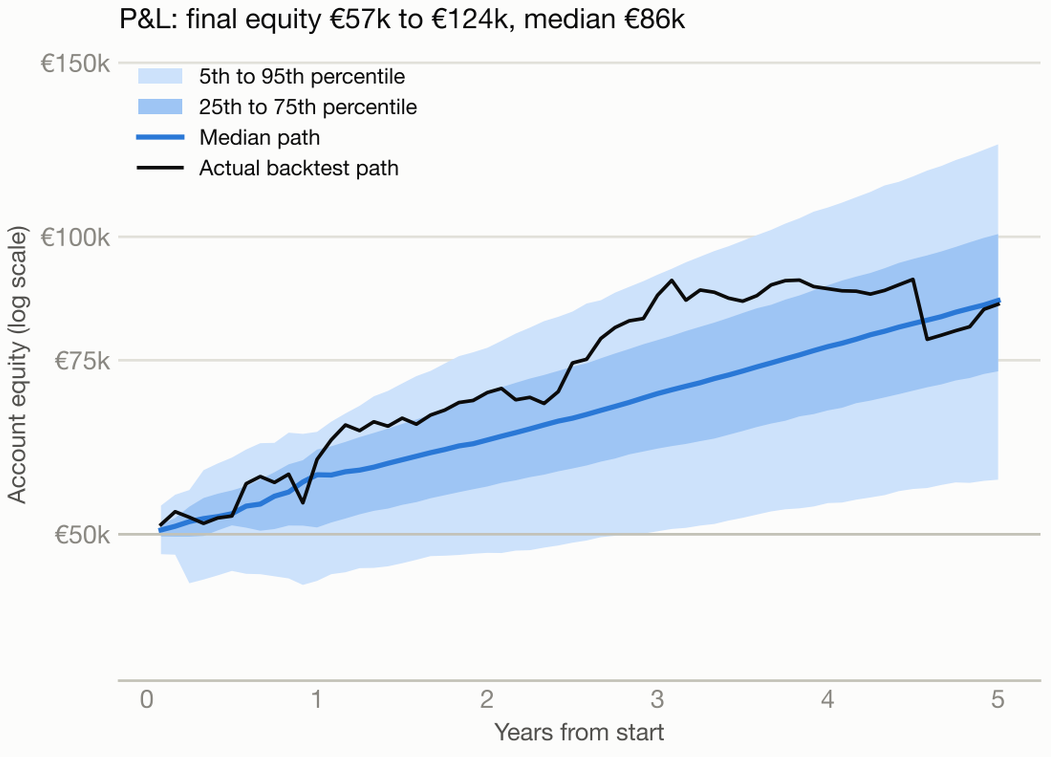

Position: whole contracts held (10% volatility target on current equity, resized monthly)

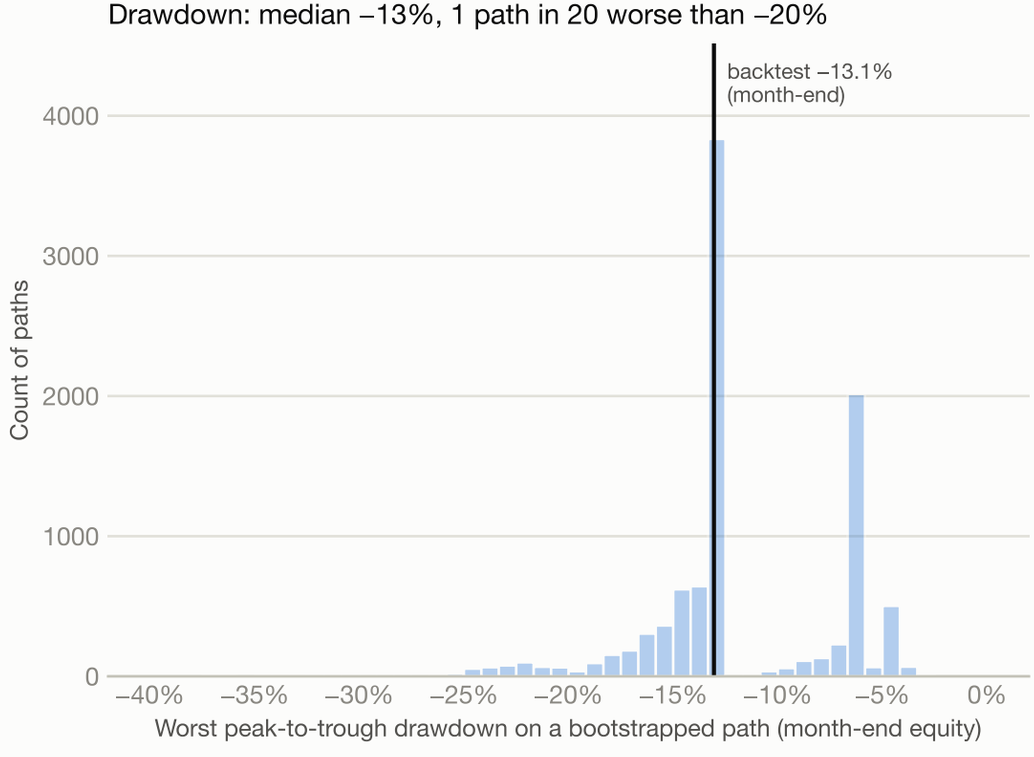

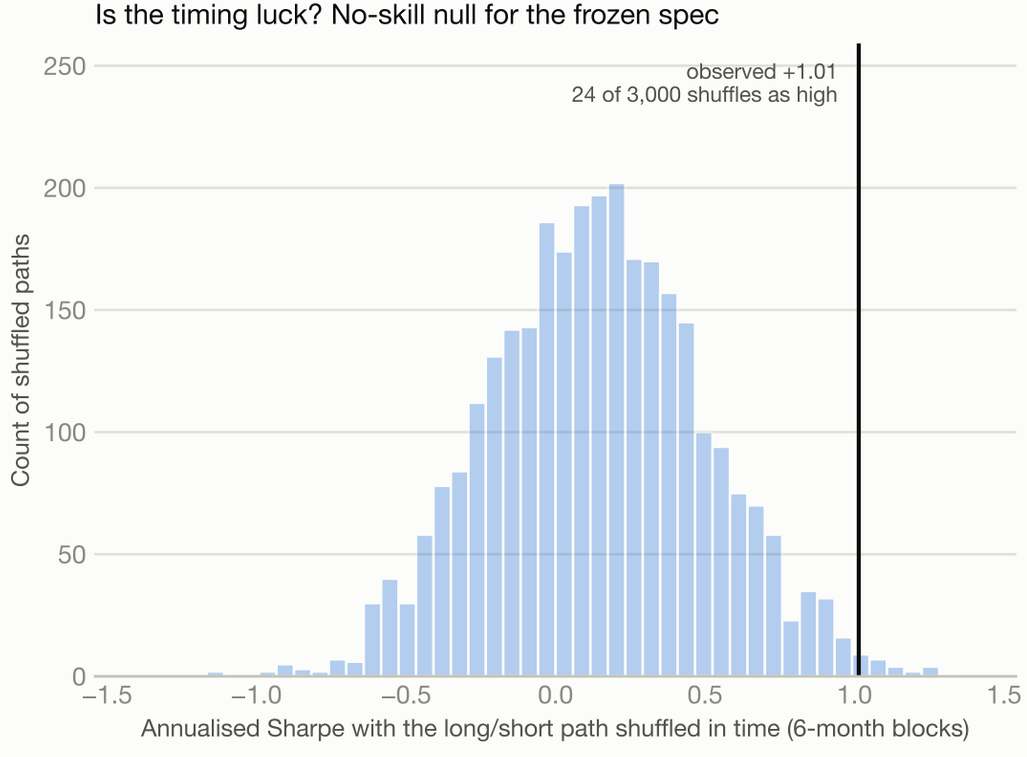

Margin deployed: average 1.8% of equity, peak 4.3%; the other 96%+ stays in cash

Sharpe: frozen spec median +1.05, 90% interval +0.29 to +1.81
dashed line = median of each distribution
Frozen spec: median +1.05
Long-only: median −1.10
ECB rate momentum: median +0.70
Density
Annualised Sharpe of a bootstrapped 60-month path

P&L: final equity €57k to €124k, median €86k
5th to 95th percentile
25th to 75th percentile
Median path
Actual backtest path
Account equity (log scale)
Years from start

Drawdown: median −13%, 1 path in 20 worse than −20%
backtest −13.1%
(month-end)
Count of paths
Worst peak-to-trough drawdown on a bootstrapped path (month-end equity)

Is the timing luck? No-skill null for the frozen spec
observed +1.01
24 of 3,000 shuffles as high
Count of shuffled paths
Annualised Sharpe with the long/short path shuffled in time (6-month blocks)
